

# BAVATOP

medium late to late  
starch variety with broad  
nematode resistance

Bavatop is an interesting starch variety for the production of high starch yield even on soils with problems of nematodes.

# VARIETY DESCRIPTION

## YIELD

Very high starch content (up to 24%) very high starch yield, medium-high number of tubers; regular calibration.

## RESISTANCES

- › Nematodes Ro 1, 3, 4, 5; PA 2, 3
- › Y-Virus (PVY) high
- › potato leaf roll medium
- › late blight high
- › black leg high
- › common scab medium
- › potatoe wart disease 1

## TUBER / PLANT

Short-oval shape; depth of eyes shallow to medium light yellow flesh.

## PLANT

Intensive blue coloured flowers; erect, tall plant.

## AGRONOMIC ADVICE

Bavatop should be planted in rows allowing 32–34 cm in a well prepared seedbed with regular water supply. Seed tubers should be warmed up before planting; Bavatop shows no sensitive reaction to late Metribuzin application; Due to a good tolerance to late blight, spraying intervals can be less than average; N-supply up to 150 kg N / ha and potassium up to 300 kg / ha is recommended.

This variety description is based on official trials and our own experience. For potatoes are natural products we can not undertake liability for the given description. Bavatop was bred conventional without using any gene modifying methods.
